DATE: September 4, 2015

FR: Dave Vautin, MTC

RE: Vital Signs: Environment

Over the past eight months, MTC has been releasing performance monitoring data as part of the Vital Signs initiative, which builds upon the performance framework established in Plan Bay Area by tracking regional trends. Vital Signs focuses on the measurement of regional progress towards key transportation, land use, environmental, and economic policy goals. The effort seeks to better inform the public and policymakers about critical regional issues by presenting historical data both at a regional and a local scale through an interactive and customizable website.

**Environmental Indicators**

MTC worked collaboratively with our regional partners at the Bay Area Air Quality Management District (BAAQMD) and the San Francisco Bay Conservation and Development Commission (BCDC) to identify seven key environmental indicators for tracking on Vital Signs. In August, MTC released data on these indicators to the Vital Signs website, marking the fourth and final release of the project:

- Particulate matter concentrations
- Ozone concentrations
- Greenhouse gas emissions
- Fatalities from crashes
- Injuries from crashes
- Bay restoration
- Vulnerability from sea level rise

The attached presentation highlights the four primary themes of the Environment release and incorporates a summary of data relevant to each theme:

1. While the region continues to grapple with particulate emissions in highly impacted areas, the fact remains that the region's air quality has never been better in the last half-century than it is today.
2. Thanks to shorter trip distances and high non-auto mode shares, San Franciscans lead the way with the lowest per-capita emissions amongst Bay Area residents.
3. Improved vehicle technologies have reduced fatalities and injuries from crashes despite growing traffic volumes and increasing regional population; despite this, vulnerable users have not seen declines commensurate with motorists.
4. Strict bay fill regulations enacted in the late 20<sup>th</sup> century have prevented degradation to this natural resources over the past half-century; our region's 21<sup>st</sup> century challenge is to protect residents at risk from sea level rise.

More detailed narratives on environmental trends can be found on the Vital Signs website.

### **Overarching Key Findings**

In total, Vital Signs incorporates nearly 40 performance indicators and approximately 200 datasets – with dozens of findings included across various narratives. Staff was directed by the joint MTC Planning and ABAG Administrative Committee to identify overarching findings across the various performance indicators, given the scope of the Vital Signs analysis. While it is impossible to incorporate every measure and conclusions into this findings, staff has identified four common threads across the measures as the key findings of the overall project:

1. An emphasis on protecting our region's environment has resulted in cleaner air, healthier ecosystems, and more abundant open space.
2. The Bay Area's combination of a booming economy and constraints on development has resulted in limited housing production and serious affordability challenges, leaving residents and companies with the tough choice between the advantages of one of America's most innovative but expensive regions or locating in a more affordable metro.
3. The Bay Area may be just starting to turn a corner towards more sustainable land use patterns – in particular, transit-served urban neighborhoods could have positive effects on transit usage and congestion.
4. We are much more complex than "One Bay Area". The substantial differences that exist across the region – with respect to relative prosperity, housing opportunities, environmental conditions and transportation options, to name just a few – highlight the challenge we face in tailoring policies that benefit the region as a whole.
